

A Geospatial Revolution (Powered by AI) for Energy

DEBORAH HUMPHREVILLE -DIRECTOR OF ENERGY EMEAR | DIGITALGLOBE

See a better world.™

We captured these data boulders ...

But they were stuck “in jail”

DeepCore Machine Learning Abstraction Framework

DeepCore is a utility toolkit, written in modern C++ (C++11) by [DigitalGlobe](#)

It allows a user to download, perform either image classification or object detection, and manipulate geospatial vector files. DeepCore is intended to be a machine learning framework agnostic toolkit, allowing for a simple, clean, consistent programmatic interface. It also provides easy access to the DigitalGlobe imagery archive. As new machine learning techniques and frameworks emerge, they can easily be integrated into DeepCore. This allows developers using DeepCore to easily extend their applications with the latest technology, without having to worry about the complexities of each framework or

DeepCore's machine learning features can also be accelerated by the use of Nvidia Graphics Processing Units (GPUs) using [CUDA](#) technology. By enabling GPU mode, the process of object detection becomes very quick, allowing for faster and more efficient processing of large geographic areas. The use of GPUs to accelerate machine learning and object detection processes is highly recommended.

THE CHALLENGE for FINDING OIL

HOW DO WE ANALYSE ALL SENSOR DATA INTO SOMETHING RELEVANT ?

It's all about the **information**

+

+

+

+

Data

Customer data such as sensor data, your data and access to DigitalGlobe's entire imagery archive, plus 3rd party data including RADAR

Compute

Highly scalable compute architecture for parallel processing of analytics

Ecosystem

Access to DigitalGlobe, partners and developer and proprietary ecosystem of algorithms

Analytics

ENVI, CrowdAI, ThinkTopic, Similarity, Exogenesis, SAP Hanna,

Information

Asset monitoring, Specialized Change Detection, Building Footprints, etc.

Deep Learning

hidden layer 1

Goal

Benefits

- Cost Savings
- Decrease downtime
- Higher efficiencies
- Better handle of Inventories
- Predict transport & travel logistics
- Optimize energy consumption
- Reduce carbon emission
- Detecting unusual Patterns through Analytics

7.6

million square km

24

million people

13

million structures

spatial analysis at
CONTINENTAL SCALE

Geoscape - Turning data into information

Spatial database w/ building attributes

Roof material extraction

Digital Surface Model—Elevation map

High-resolution land cover map

Building footprint extraction

High-resolution satellite imagery

Analytics

- Machine Learning
 - Object Detection
 - Feature Extraction
- Generalized Change Detection
- Anomaly Detection
- In House Analytics
- ESRI Raster Analytics
- ENVI Algorithms

Key Drivers

- Explosion of new algorithms/methods not integrated with existing work streams
- Procurement activities protracted and complex
- All require large volumes of data access to be relevant
- Accelerate ecosystem growth to drive solutions for niche/unique demands

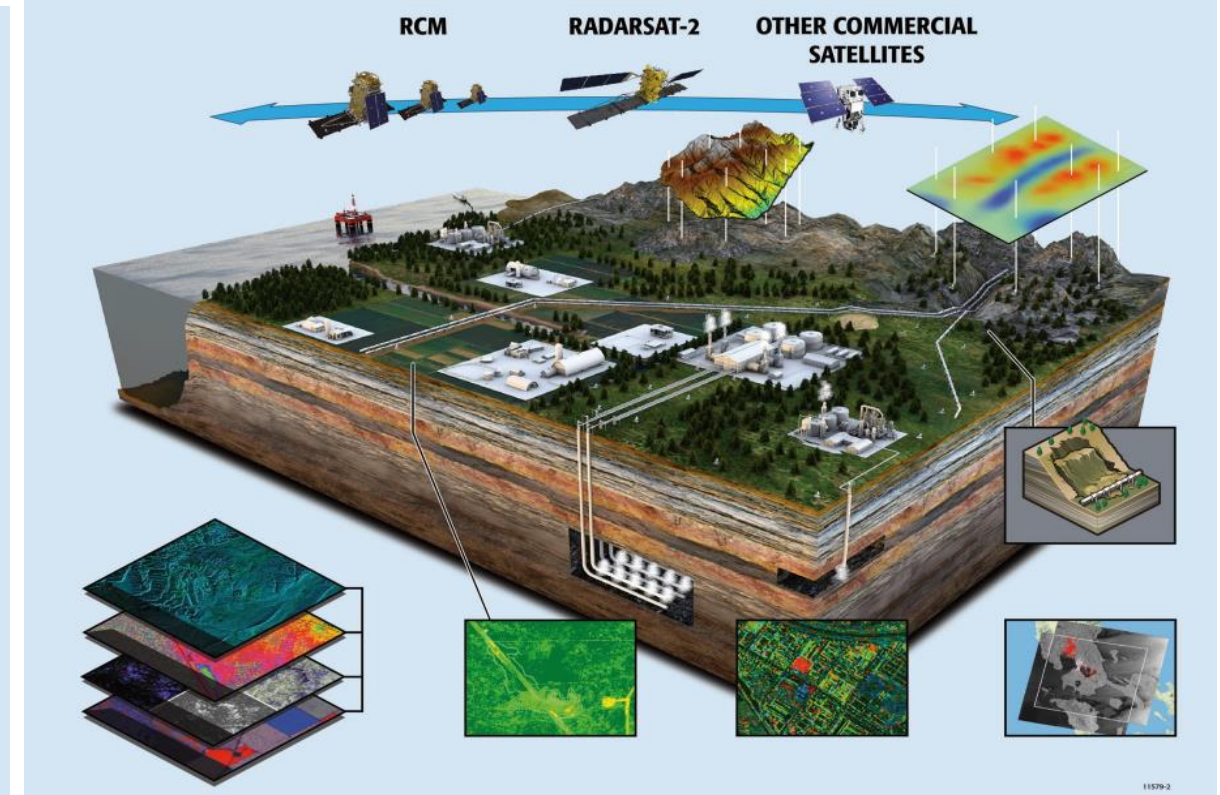

...enabling the creation of continental scale location intelligence products

Operations Analytics

- Oil on water detection from all source
- Natural Seep Studies
- Incident response support
- Vessel/platform monitoring
- Metocean information
- Shoreline sensitivity mapping

- Ground Movement and Geo-hazard Monitoring
- Enhanced Oil Recovery Monitoring
- Pipeline monitoring
- Change Detection
- Historical Movement Analysis
- Digital Elevation Models
- Map Products

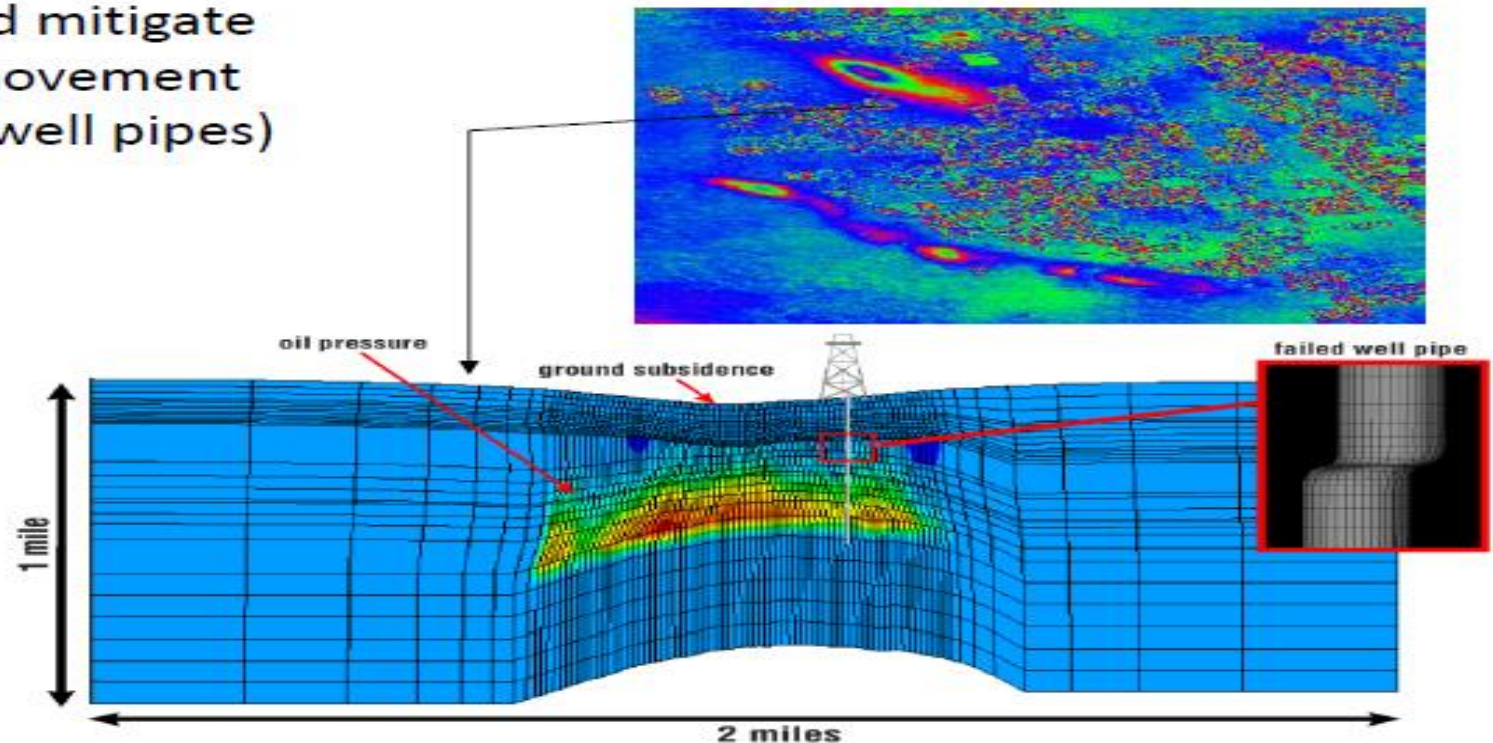

What if you could predict damage to wells ?

Production Monitoring

- Ground movement data can be used to optimize operations and mitigate the impact of ground movement on infrastructure (e.g., well pipes)

Information Layers

- Unconventional Asset Monitoring
- Pipeline Monitoring
- Land based Asset Monitoring
- Infrastructure Monitoring
- Building Extraction
- Oil Seep Mapping
- Road Extraction
- Competitive intelligence
- Refinery and Tank Farm Monitoring

Key Drivers

- “Best available” data sets derived from most current content
- Customers indicate they have analysis needs but don’t want to create every Information Layer themselves.
- Support a larger market

From Production to Storage

Pipeline and Asset Detection

Customer Requirement

Rapid assessment

pads and assets from
space

Challenge

How to detect and
monitor pipelines and
assets in a cost efficient
manner

Solution

Large scale automated
asset detection
combined with optical,
radar, and other source
of surveillance

Benefit

Cost effective
monitoring of assets in
urban, and or remote
locations

Floating Tank Lid Monitoring

Tank ID	Oil Volume (m^3)	Oil Volume (bbl)	% Full
0	16100.74	101270.60	80.50
1	12201.48	76744.99	61.01
2	2046.45	12871.81	10.23
3	13712.63	86249.85	68.56
4	7425.26	46703.49	37.13
5	14485.61	91111.76	72.43
6	16100.74	101270.60	80.50
7	16100.74	101270.60	80.50
8	16100.74	101270.60	80.50
9	1701.37	10701.32	10.01
10	6423.56	40402.95	37.79
11	9350.69	58814.05	55.00
12	12851.58	80833.99	75.60

Customer Requirement

Monitoring of floating tank lids to add critical information to trading algorithms

Challenge

How to determine information on oil inventories that are not publically reported on a regular basis

Solution

Two measurement methodologies to calculate oil tank volume levels from high resolution imagery. Calculations Include volume capacity, temporal monitoring, historical Trends

Benefit

Timely, accurate, reliable, measurements on a global basis to fit the customers needs

Health, Safety and Environment - locating people to delivering vaccines to protecting assets

SpaceNet satellite imagery repository launched by DigitalGlobe, CosmiQ Works and NVIDIA on AWS

Posted Aug 25, 2016 by [John Mannes \(@JohnMannes\)](#)

A consortium of companies, including [DigitalGlobe](#), [CosmiQ Works](#) and [NVIDIA](#), today launched [SpaceNet](#), an open-data initiative aimed at improving image analysis tools.

The screenshot displays the PENNY web application interface overlaid on an aerial photograph of a city street grid. At the top left, the word "PENNY" is written in large, bold, pink letters. Below it, the text "New York / St.Louis" appears in pink. A white search bar with a magnifying glass icon and the placeholder text "Search" is positioned below the location text. To the right of the search bar are two small square buttons with "+" and "-" symbols. Further right is a small inset map showing a larger geographic area with a red pin indicating the current location. On the right side of the screen, there is a semi-transparent white panel containing text. The first paragraph states: "U.S. Census data defines this area as being in a HIGH median income bracket." The second paragraph states: "PENNY is 84% confident that this is a LOW median income area." Below this text is a horizontal line. Underneath the line, it says: "Please drag objects into the center of the map to run PENNY." At the bottom right of this panel is a pink button with the text "Run PENNY!". In the top right corner of the overall image, outside the main application window, are logos for "DigitalGlobe", "Stamen", and "Carnegie Mellon University".
